api.py - FastAPI Web Front Door

What this file does (big picture)

api.py exposes the agent over HTTP so websites and services can call it.

Endpoints:

```
GET  /health          - is the service up?
POST /v1/support/ask  - send a question, get a reply + metadata
GET  /docs            - interactive Swagger UI (built into FastAPI)
```

Run: uvicorn api:app --app-dir app --reload

New words you will see in this file

HTTP API	Programs talk using URLs and JSON instead of a terminal prompt.
FastAPI	Modern Python web framework with automatic docs and validation.
Uvicorn	The server program that listens on a port and runs FastAPI.
CORS	Browser security rule; we relax it for local demos.
endpoint	One URL + method (GET/POST) that does a job.

Flow while the program runs

Client POST /v1/support/ask JSON -> FastAPI validates with schemas ->
handle_question(...) -> SupportAskResponse JSON.

api.py - FastAPI Web Front Door

1-20

```
"""FastAPI web entry point..."""
```

Plain English:
Docstring explains HTTP vs CLI and how to run uvicorn.

27-40

```
app = FastAPI(...)
```

Plain English:
Create the application object (title, description, version).

42-50

```
CORSMiddleware
```

Plain English:
Allow browser frontends to call the API during local demos.

53-62

```
GET /health
```

Plain English:
Liveness check including AI client status line.

65-78

```
POST /v1/support/ask
```

Plain English:
Main integration point: body.question -> handle_question -> JSON.

81-88

```
GET /
```

Plain English:
Tiny index pointing humans to /docs and key routes.
