agent_service.py - One Brain, Many Doors

What this file does (big picture)

agent_service.py is the shared pipeline used by CLI and FastAPI.

handle_question(question, channel=...) runs:
guardrails -> classify -> facts/responses -> output guardrails -> log

Returning AgentResult keeps channels thin: they only display or JSON-encode.

New words you will see in this file

service layer	Business logic shared by CLI, HTTP, and future webhooks.
AgentResult	A structured result object (reply, outcome, action, escalation).
channel	cli / api / twilio - recorded for escalation and logging context.

Flow while the program runs

api.py or main.py -> handle_question -> AgentResult -> print or JSON response.

agent_service.py - One Brain, Many Doors

1-12

```
"""Shared support agent pipeline..."""
```

Plain English:
Docstring: one brain for every front door.

57-72

```
@dataclass class AgentResult
```

Plain English:
Channel-agnostic result with to_dict() for the API.

75-90

```
def handle_question(...)
```

Plain English:
Public entry: take question + channel, return AgentResult.

91-120

```
input guardrails block/escalate branches
```

Plain English:
Same safety as before, but returns data instead of printing.

122-220

```
lane handlers (sleep/order/product/account/returns)
```

Plain English:
Facts + render + output guardrails + log for each answered lane.

222-250

```
escalation fallback
```

Plain English:
Build packet, customer reply, log, return escalation dict.
