request_log.py - Remember What Happened

What this file does (big picture)

request_log.py is a learning-friendly diary for each support request.

After every question, main.py writes one line with:
- timestamp
- question
- classification (lane), if we got that far
- action taken (order lookup, knowledge reply, guardrail block, ...)
- outcome (answered / escalated / blocked)
- optional notes

Format: JSONL (one JSON object per line) in data/logs/support_requests.jsonl
Log files are gitignored so practice questions do not get committed.

New words you will see in this file

observability	Making the system's behavior visible after the fact.
JSONL	JSON Lines: one complete JSON record per line; easy to append.
append-only	We add lines; we do not rewrite history each run.
outcome vs action	Outcome = how it ended; action = what we did to get there.

Flow while the program runs

main finishes a path (answer / block / escalate) ->
log_request(...) opens support_requests.jsonl and appends one line.

request_log.py - Remember What Happened

1-12

```
"""Simple request log..."""
```

Plain English:
Module docstring: learning log, not full compliance audit.

14-18

```
imports: json, datetime, Path
```

Plain English:
JSON for the record shape; UTC timestamps; Path for the log file location.

20-22

```
LOG_DIR / LOG_PATH
```

Plain English:
data/logs/support_requests.jsonl under the project root.

24-36

```
OUTCOME_* and ACTION_* constants
```

Plain English:
Shared vocabulary so main.py does not scatter magic strings.

39-66

```
def log_request(...)
```

Plain English:
Build a dict, ensure the folder exists, append one JSON line, return the path.
